Key Features of AutoCAD: It was the first CAD package designed to serve as an integrated application for drafting, design, and construction, or what it calls "cad-for-construction". An extensive set of tools designed for architectural, engineering, and industrial drafting, including a vast library of industry-standard drawings (both vector and raster) An easy-to-use, graphical interface that provides a quick-access help system and a time-saving software design tool, without sacrificing control over the layout and dimensioning of objects Arrays, layers, and templates are an integral part of the AutoCAD environment. Drawings are created with text styles, line styles, hatch patterns, 3D effects, and photographic imaging. The program includes full editing capabilities for sheet metal, beams, piping, and stairs. AutoCAD is widely used in schools, and has extensive educational support. The latest version of AutoCAD for R16 is available for free. .NET is a programming language derived from BASIC-PLUS, and the .NET framework uses Microsoft's Common Language Runtime (CLR). .NET is closely related to C# and Visual Basic. It is an object-oriented programming language with a focus on simplicity, efficiency and portability. Unlike C, C# and Visual Basic, .NET supports multi-language programming, allowing programmers to write code in the .NET Framework in any language they choose, and then compile and execute it. Visual Basic is a scripting language from Microsoft for general programming with the .NET Framework. It was the first scripting language to be developed for use with the .NET Framework, and was originally called Visual Basic.NET. It is a general-purpose programming language. VBA is a macro scripting language from Microsoft for use with the Microsoft Office productivity suite. It allows automation of the Microsoft Office user interface. It can be used for many purposes, from data entry, to application automation, to creation of forms and reports. AutoLISP is a Microsoft's scripting language and a dialect of the LISP programming language. I have been using the command prompt in Windows (i.e. cmd.exe) for years, and until yesterday I could always "ctrl+c" to stop any running programs. However, since yesterday, that "command" (not a keyboard shortcut!) has changed, and now pressing ctrl+c opens an Explorer window to my desktop. I have not changed anything about the keyboard shortcuts, and I cannot find anything that states this change. What is causing this and what is the correct way to stop programs in Windows?
