This library contains a lot of useful time related routines. Whether it's the time of the year, a certain date, the current time zone, the number of weeks in a year, a certain time period, or a certain date in a calendar month, there are a lot of available functions that will help you find and manage any information about it. Some features include a simple form designer for the format and format editor, a customizable format editor, and a calendar generator. The form designer, which resembles the editor of Windows Form, is used to create forms containing form fields. There are a lot of options to set the position and appearance of the form elements. This is not the best choice if you're looking for an easy-to-use PDF editor, but for anyone who is familiar with forms and wants an alternative to Microsoft Word, this tool will definitely be a nice addition. Beyond this, there are a lot of interesting tools included in the package. The designer can also be used to create a dialog window, along with options to customize its position, transparency, etc. The format editor can be used to clean up a template; there are already a lot of formats included in the application. You can set parameters for the templates, and you can also apply rules to them. Likewise, the template itself can be created, along with user-defined ones. There are also options to set the foreground and background color, the padding, and the position of the elements. The calendar generator, one of the main features of the application, can show the current month, week, week number, the day of a week, day of a month, and years that contain a given month. You can also place events on the calendar and set the date and time of the event. The events can be selected from a list, or you can type in a custom date and time, making this a very versatile tool. The calendar is integrated with the daily and weekly views. The developers warn that it works best when there are 100 days in a
